☐ Continuation Sheet Attached**Brief Description of Arguments to be Presented:**

--Applicant proposes amending the independent claims to include that the state of the integrated circuit is saved to a non-volatile memory when an unrecoverable error occurs in the integrated circuit and the internal clocks of the integrated circuit have been stopped.

--For 102 Rejection, Vachon '404 does not disclose or suggest this. Vachon discloses an operating system failure, not a failure of an integrated circuit; and the system is still running after failure, allowing the debugger operation, so that internal clocks of any integrated circuits are not stopped. Also, the operating system can resume execution, and so has not experienced an unrecoverable error.

--For 103 Rejections: Vachon '348 and Masuyama also do not disclose saving a state of an integrated circuit after unrecoverable error of the integrated circuit and when internal clocks of the integrated circuit have been stopped; these references show operating system failure, continued operation, and resuming execution of the operating system, similarly to Vachon '404.
